

### **GENERAL INFORMATION**

# **AC200+**™

Acrylic Injection Adhesive Anchoring System and Post-Installed Reinforcing Bar Connections

#### PRODUCT DESCRIPTION

The AC200+ is a two-component, high strength adhesive anchoring system. The system includes injection adhesive in plastic cartridges, mixing nozzles, dispensing tools and hole cleaning equipment. AC200+ is designed for bonding threaded rod and reinforcing bar hardware into drilled holes in concrete base materials and for post-installed reinforcing bar connections (rebar development).

#### **GENERAL APPLICATIONS AND USES**

- High strength anchoring: bonding threaded rod and reinforcing bar into hardened concrete
- Rebar development length and lap splice connections in concrete up to 60d embedments
- Evaluated for installation and use in dry and wet concrete (including water-filled holes)
- Cracked and uncracked concrete conditions as well as wind and seismic loading (SDC A F)
- Oversized hammer-drilled holes in concrete, for short term loading only (see www.DEWALT.com)
- Can also be considered for filling large cracks and abandoned holes in concrete and masonry

#### **FEATURES AND BENEFITS**

- + Fast curing system which can be applied in structural applications as low as 14°F (-10°C)
- + Evaluated and recognized for freeze/thaw performance and sustained loading
- + Can be used in a wide range of embedments in low and high strength concrete
- + Cartridge design allows for multiple uses using extra mixing nozzles
- + Mixing nozzles proportion adhesive and provide simple delivery method into drilled holes
- + Evaluated and recognized for long term and short term loading (see performance tables)
- + In-service temperature ratings between -40°F (-40°C) and 320°F (160°C)

#### APPROVALS AND LISTINGS

- International Code Council, Evaluation Service (ICC-ES) ESR-4027 for cracked and uncracked concrete
- Code Compliant with the International Building Code/International Residential Code: 2021 IBC/IRC, 2018 IBC/IRC, 2015 IBC/IRC, and 2012 IBC/IRC
- Tested in accordance with ACI 355.4, ASTM E488, and ICC-ES AC308 for use in structural concrete with design according to ACI 318 (-19 & -14), Chapter 17 and ACI 318-11 Appendix D
- Evaluated and qualified by an accredited independent testing laboratory for recognition in cracked and uncracked concrete including static, wind and seismic loading
- Tested and qualified for use in post-installed rebar connections including rebar development and lap splices in accordance with ICC-ES AC308 Table 3.8 and ACI 318 Chapter 12 and Chapter 25
- City of Los Angeles, LABC and LARC Supplement (within ESR-4027)
- Florida Building Code, FBC Supplement including HVHZ (within ESR-4027)
- European Technical Approval, ETA-16/0905 (adhesive anchors), ETA-16/0904 (post-installed rebars)
- Compliant with NSF/ANSI 61 for drinking water system components health effects
- Compliant to California DPH for VOC emissions and South Coast AQMD for VOC content (LEED v4.1)
- Conforms to requirements of ASTM C881 including C882 and AASHTO M235, Types I, II, IV and V, Grade 3, Class A and conforms to requirements of ASTM C881 Types I and IV, Grade 3, Class B
- Department of Transportation listings see www.DEWALT.com or contact transportation agency

#### **GUIDE SPECIFICATIONS**

CSI Divisions: 03 16 00 - Concrete Anchors, and 05 05 19 Post-Installed Concrete Anchors. Adhesive anchoring system shall be AC200+ as supplied by DEWALT, Towson, MD. Anchors shall be installed in accordance with published instructions and requirements of the Authority Having Jurisdiction.

AC200+ ADHESIVE IN CARTRIDGE (STANDARD THREADED ROD AND REBAR STEEL SUPPLIED BY OTHERS)

### **PACKAGING (10:1 MIX RATIO)**

## Coaxial Cartridge

- 9.5 fl. oz. (280 mL or 17 in<sup>3</sup>)
- 14 fl. oz. (420 mL or 25.5 in³)

### **Dual Cartridge (side-by-side)**

• 28 fl. oz. (825 mL or 50 in<sup>3</sup>)

### STORAGE LIFE & CONDITIONS

Eighteen months in a dry, dark environment with temperature ranging from 41°F to 77°F (5°C to 25°C)

### **ANCHOR SIZE RANGE (TYPICAL)**

- 3/8" to 1-1/4" diameter threaded rod
- . No. 3 to No. 10 reinforcing bar (rebar)
- 10M to 30M reinforcing bar (CA rebar)

# **SUITABLE BASE MATERIALS**

- Normal-weight concrete
- · Lightweight concrete
- Grouted concrete masonry

# PERMISSIBLE INSTALLATION CONDITIONS (ADHESIVE)

- Dry concrete
- Water-saturated concrete (wet)
- · Water-filled holes (flooded)

# **MATERIAL SPECIFICATIONS**

AC200+ is a high strength, non-sag, acrylic hybrid adhesive. The formula does not contain styrene.

AC200+ conforms to requirements of ASTM C881 and AASHTO M235, Types I, II, IV and V, Grade 3, Class A and Types I and IV, Grade 3, Class B (also meets Type III except for elongation).

# **Properties of Cured Adhesive**

| Property                                   | (Standard)          | Units                | Value                  |  |
|--------------------------------------------|---------------------|----------------------|------------------------|--|
| Consistency (ASTM C                        | 881)                | Non-sag              | (Grade 3)              |  |
| Compressive Yield Str<br>(ASTM D695)       | rength @ 7 days     | psi                  | 15,105                 |  |
| Compressive Modulus                        | s (ASTM C881)       | psi                  | 412,930                |  |

| Linear Coefficient of S<br>(ASTM C881)     | Shrinkage on Cure   | in./in.              | .005                   |  |
| Heat Deflection Temp<br>(ASTM C881)        | erature @ 7 days    | °F                   | 181                    |  |
| Shore D Hardness (D                        | IN EN ISO 868)      | -                    | 90                     |  |
| Gel time<br>(ASTM C881)                    | @ 23°F              | minutes<br>(minimum) | 30                     |  |
| Electrical resistance, resistance (IEC 93) | specific surface    | Ω                    | 7.2 x 10 <sup>13</sup> |  |
| Watertightness (DIN E                      | EN 12390-8)         | mm                   | zero                   |  |

<sup>\*</sup>There is no requirement in ASTM C881 and AASHTO M235 for viscosity, tensile strength or tensile elongation of Grade 3 products.

# **Gel (working) Time and Curing Table**

| aci (ironang) inno ana       | ourning labile     |                  |
|------------------------------|--------------------|------------------|
| Temperature of base material | Gel (working) time | Full curing time |
| 14°F (-10°C) to 22°F (-6°C)  | 60 minutes         | 24 hours         |
| 23°F (-5°C) to 31°F (-1°C)   | 50 minutes         | 5 hours          |
| 32°F (0°C) to 40°F (4°C)     | 25 minutes         | 3.5 hours        |
| 41°F (5°C) to 49°F (9°C)     | 15 minutes         | 2 hours          |
| 50°F (10°C) to 58°F (14°C)   | 10 minutes         | 1 hour           |
| 59°F (15°C) to 67°F (19°C)   | 6 minutes          | 40 minutes       |
| 68°F (20°C) to 85°F (29°C)   | 3 minutes          | 30 minutes       |
| 86°F (30°C) to 104°F (40°C)  | 2 minutes          | 30 minutes       |

Linear interpolation for intermediate base material temperature is possible.

Cartridge temperature must be between 41°F (5°C) and 104°F (40°C) when in use; except for installations in base material temperatures between 14°F and 23°F (-10°C and -5°C) the cartridge temperature must be conditioned to 50°F (10°C) minimum.

#### **Chemical Resistance**

| Chemical Agent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Chemical Resistance             |       |           |   |

- 1. Embedment range qualified for use with the anchor design provisions of ACI 318 (-19 and -14) Ch. 17 or ACI 318-11 Appendix D as applicable, ICC-ES AC308, and ESR-4027.
- 2. For rebar development lengths with embedments up to 60d, see the table for Installation Parameters for Common Post-installed Reinforcing Bar Connections.
- 3. Torque may not be applied to the anchors until the full cure time of the adhesive has been achieved.
- 4. For ASTM A36/F1554 Grade 36 carbon steel threaded rods with 3/8-inch-diameter, T<sub>max</sub> = 11 ft.-lbs.
- 5. For installations below the minimum edge distance, Cmin, down to the reduced minimum edge distance, Cmin, the reduced maximum toque is 0.45\*Tmax.
- 6. For installations below the minimum edge distance, cmin, down to the reduced minimum edge distance, cmin,red, the minimum anchor spacing, Smin is 5da.

# Detail of Steel Hardware Elements used with Injection Adhesive System

#### Nomenclature

da (d) = Diameter of anchor

d<sub>o</sub> (d<sub>bit</sub>) = Diameter of drilled hole

h = Base material thickness h<sub>nom</sub> (h<sub>ef</sub>) = Embedment depth

s = Spacing of anchors

c = Edge distance

max = Maximum torque

For SI: 1 inch = 25.4 mm, 1 lbf = 4.448 N. For pound-inch units: 1 mm = 0.03937 inches, 1 N = 0.2248 lbf.

For St: 1 inch = 25.4 mm, 1 lbf = 4.448 N. For pound-inch units: 1 mm = 0.03937 inches, 1 N = 0.2248 lbf.

1. Values provided for steel element material types are based on minimum specified strengths and calculated in accordance with ACl 318-19 Eq. 17.6.1.2 and Eq. 17.6.1.2 and Eq. 17.5.1.2b or ACl 318-11 Eq. (D-2) and Eq. (D-29), as applicable, except where noted. Nuts and washers must be appropriate for the rod. Nuts must have specified proof load stresses equal to or greater than the minimum tensile strength of the specified threaded rod.

2. The tabulated value of φ applies when the load combinations of Section 1605.2 of the IBC, ACl 318 (-19 or -14) 5.3 or ACl 318-11 9.2, as applicable, are used in accordance with ACl 318-19 Section 17.5.3 or ACl 318-14 17.3.3 or ACl 318-11 D.4.3, as applicable. If the load combinations of ACl 318-11 Appendix C are used, the appropriate value of φ must be determined in accordance with ACl 318 D.4.4.

# Steel Tension and Shear Design for Reinforcing Bars in Normal Weight Concrete

|                                                       | Burlow Information                                 | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |              |                 |                  | Nomina           | l Reinforcir     | g Bar Size (                              | (Rebar)¹                                                |             |                    |  |

For SI: 1 inch = 25.4 mm, 1 lbf = 4.448 N. For pound-inch units: 1 mm = 0.03937 inches, 1 N = 0.2248 lbf.

- 1. Values provided for reinforcing bar material types based on minimum specified strengths and calculated in accordance with ACI 318-19 Eq. 17.6.1.2 and Eq. 17.5.1.2 b or ACI 318-11 Eq. (D-2) and Eq. (D-2), as applicable.
- 2. The tabulated value of φ applies when the load combinations of Section 1605.2 of the IBC, ACI 318 (-14 & -19) 5.3 or ACI 318-11 9.2, as applicable, are used in accordance with ACI 318-19 17.5.3, ACI 318-14, 17.3.3 or ACI 318-11 D.4.3, as applicable. If the load combinations of ACI 318-11 Appendix C are used, the appropriate value of φ must be determined in accordance with ACI 318 D.4.4.

<sup>1.</sup> Values provided for common bar material types based on specified strengths and calculated in accordance with ACI 318-19 Eq. 17.6.1.2 and Eq. 17.7.1.2(b) or ACI 318-14 Eq. 17.4.1.2 and Eq. 17.5.1.2b or ACI 318-11 Eq. (D-2) and Eq. (D-29), as applicable.

<sup>2.</sup> The tabulated value of  $\phi$  applies when the load combinations of Section 1605.2 of the IBC, ACI 318 (-19 or -14) 5.3 or ACI 318-11 9.2, as applicable, as set forth in ACI 318-19 17.5.3, ACI 318-14 17.3.3 or ACI 318-11 D.4.3, as applicable, are used. If the load combinations of ACI 318-11 Appendix C are used, the appropriate value of  $\phi$  must be determined in accordance with ACI 318 D.4.4.

| Strength reduction factor for shear, concrete failure modes, Condition B <sup>4</sup>   | φ                    | -            |                |                                                                                                                                                                                                                                                               |                                         | 0.70                                |                                                              |                              |                |

For SI: 1 inch = 25.4 mm, 1 lbf = 4.448 N. For pound-inch units: 1 mm = 0.03937 inch, 1 N = 0.2248 lbf.

- 1. Additional setting information is described in the installation instructions.
- 2. For installation between the minimum edge distance, cmin, and the reduced minimum edge distance, cmin, the maximum torque applied must be reduced (multiplied) by a factor of 0.45.
- 3.  $\tau_{\text{kumer}}$  need not be taken as greater than:  $\tau_{\text{kumer}} = \frac{\text{kumer} * \sqrt{\text{hef} * f'c}}{\pi * d}$  and  $\frac{h}{h_{\text{ef}}}$  need not be taken as larger than 2.4.

| Reduction factor for                                                                                     | seismic tension <sup>9</sup>                       | ∠ N,seis                              | -              |                 |                 |                 | 0.95            |                 |                 |                 |  |

For SI: 1 inch = 25.4 mm, 1 psi = 0.006894 MPa. For pound-inch units: 1 mm = 0.03937 inch, 1 MPa = 145.0 psi.

- 1. Bond strength values correspond to a normal-weight concrete compressive strength f'c = 2,500 psi (17.2 MPa). For concrete compressive strength, f'c between 2,500 psi and 8,000 psi (17.2 MPa and 55.2 MPa), the tabulated characteristic bond strength may be increased by a factor of (f'c / 2,500)<sup>0.10</sup> [For SI: (f'c / 17.2)<sup>0.10</sup>].
- Short-term elevated concrete base material service temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling. Long-term elevated concrete base material service
  temperatures are roughly constant over significant periods of time.
- 3. Characteristic bond strengths are for sustained loads including dead and live loads. For load combinations consisting of short-term loads only, such as wind, bond strengths may be increased by 23 percent for the temperature range C.

<sup>4.</sup> Condition A requires supplemental reinforcement, while Condition B applies where supplemental reinforcement is not provided or where pryout governs, as set forth in ACl 318-19 17.5.3, ACl 318-14 17.3.3 or ACl 318-11 D.4.3, as applicable. The tabulated value of φ applies when the load combinations of Section 1605.2 of the IBC, ACl 318 (-19 or -14) 5.3 or ACl 318-11 9.2, as applicable, are used in accordance with ACl 318-19 17.5.3, ACl 318-14 17.3.3 or ACl 318-11 D.4.3, as applicable. If the load combinations of ACl 318-11 Appendix C are used, the appropriate value of φ must be determined in accordance with ACl 318 D.4.4.

- For SI: 1 inch = 25.4 mm, 1 lbf = 4.448 N. For pound-inch units: 1 mm = 0.03937 inch, 1 N = 0.2248 lbf.
- 1. Additional setting information is described in the installation instructions.
- 2. For installation between the minimum edge distance, cmin, and the reduced minimum edge distance, cmin,red, the maximum torque applied must be reduced (multiplied) by a factor of 0.45.
- 3.  $\tau_{\text{k,uncr}}$  need not be taken as greater than:  $\tau_{\text{k,uncr}} = \tau_{\text{kuncr}} \cdot \sqrt{h_{\text{ef}} \cdot f'_{\text{C}}}$  and  $\underline{h}$  need not be taken as larger than 2.4.

- For SI: 1 inch = 25.4 mm, 1 psi = 0.006894 MPa. For pound-inch units: 1 mm = 0.03937 inch, 1 MPa = 145.0 psi.
- 1. Bond strength values correspond to a normal-weight concrete compressive strength f'c = 2,500 psi (17.2 MPa). For concrete compressive strength, f'c between 2,500 psi and 8,000 psi (17.2 MPa and 55.2 MPa), the tabulated characteristic bond strength may be increased by a factor of (f'c / 2,500)<sup>0.0</sup> [For SI: (f'c / 17.2)<sup>0.10</sup>]
- 2. Short-term elevated concrete base material service temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling. Long-term elevated concrete base material service temperatures are roughly constant over significant periods of time.
- 3. Characteristic bond strengths are for sustained loads including dead and live loads. For load combinations consisting of short-term loads only, such as wind, bond strengths may be increased by 23 percent for the temperature range C.

Condition A requires supplemental reinforcement, while Condition B applies where supplemental reinforcement is not provided or where pryout governs, as set forth in ACI 318-19 17.5.3,
ACI 318-14 17.3.3 or ACI 318-11 D.4.3, as applicable. The tabulated value of φ applies when the load combinations of Section 1605.2 of the IBC, ACI 318 (-19 or -14) 5.3 or ACI 318-11
9.2, as applicable, are used in accordance with ACI 318-19 17.5.3, ACI 318-14 17.3.3 or ACI 318-11 D.4.3, as applicable. If the load combinations of ACI 318-11 Appendix C are used, the appropriate value of  $\phi$  must be determined in accordance with ACl 318 D.4.4.

| Reduction factor for                                                                  | seismic tension <sup>9</sup>                       | lphaN,seis                      | -              | 0.              | 95              |                  | 1.00            |                 |

For SI: 1 inch = 25.4 mm, 1 psi = 0.006894 MPa. For pound-inch units: 1 mm = 0.03937 inch, 1 MPa = 145.0 psi.

- 1. Bond strength values correspond to a normal-weight concrete compressive strength f'c = 2,500 psi (17.2 MPa). For concrete compressive strength, f'c between 2,500 psi and 8,000 psi (17.2 MPa) and 55.2 MPa), the tabulated characteristic bond strength may be increased by a factor of (f'c / 2,500)<sup>0.10</sup> [For SI: (f'c / 17.2)<sup>0.10</sup>].
- 2. Short-term elevated concrete base material service temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling. Long-term elevated concrete base material service temperatures are roughly constant over significant periods of time.
- Characteristic bond strengths are for sustained loads including dead and live loads. For load combinations consisting of short-term loads only, such as wind, bond strengths may be increased by 23 percent for the temperature range C.

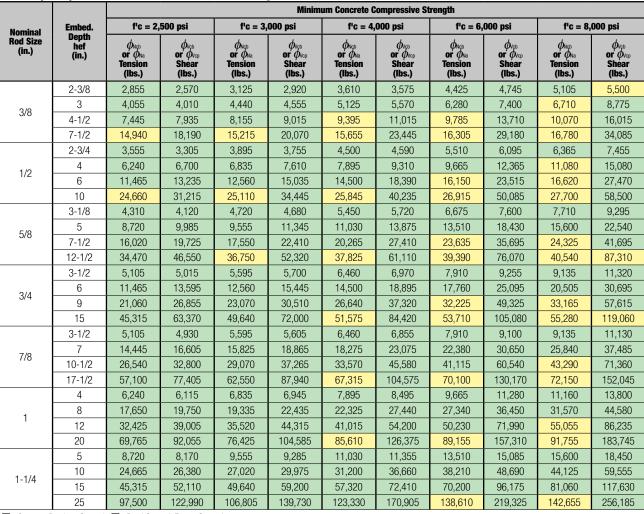

# **DESIGN STRENGTH TABLES (SD)**

Tension and Shear Design Strength for Threaded Rod Installed in Uncracked Concrete (Bond or Concrete Strength)

Drilled with a Hammer-Drill and Carbide Bit in a Dry Hole Condition

Temperature Range A: 122°F (50°C) Maximum Long-Term Service Temperature;

176°F (80°C) Maximum Short-Term Service Temperature<sup>1,2,3,4,5,6,7,8,9,10,11</sup>

<sup>□ -</sup> Concrete Breakout Strength
□ - Bond Strength/Pryout Strength

- Tabular values are provided for illustration and are applicable for single anchors installed in uncracked normal-weight concrete with minimum slab thickness, ha = hmin, and with the following conditions:
  - $c_{a1}$  is greater than or equal to the critical edge distance,  $c_{ac}$
  - Ca2 is greater than or equal to 1.5 times Ca1.
- 2. Calculations were performed according to ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308. The load level corresponding to the failure mode listed [Concrete breakout strength, bond strength/pryout strength] must be checked against the tabulated steel strength of the corresponding threaded rod or rebar size and type, the lowest load level controls.
- 3. Strength reduction factors (\$\phi\$) for concrete breakout strength are based on ACI 318 (-19 or -14) Section 5.3 for load combinations. Condition B was assumed.
- Strength reduction factors (φ) for bond strength are determined from reliability testing and qualification in accordance with ICC-ES AC308 and are tabulated in this product information and in ESR-4027.
- 5. Tabular values are permitted for static loads only, seismic loading is not considered with these tables. Periodic special inspection must be performed where required by code, see ESR-4027 for applicable information.
- 6. For anchors subjected to tension resulting from sustained loading a supplemental check must be performed according to ACI 318-19 17.5.2.2 or ACI 318-14 17.3.1.2.
- 7. For designs that include combined tension and shear, the interaction of tension and shear loads must be calculated in accordance with ACI 318 (-19 or -14) Ch.17.
- 8. Interpolation is not permitted to be used with the tabular values. For intermediate base material compressive strengths, please see ACI 318 (-19 or -14) Ch.17, ICC-ES AC308 and information included in this product supplement. For other design conditions including seismic considerations please see ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308 and ESR-4027.
- 9. Long term concrete temperatures are roughly constant over significant periods of time. Short-term elevated temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.
- 10. The tabulated design strengths may be converted to allowable stress design values. Divide by conversion factor calculated as a weighted average of the load factors for the controlling load combination
- 11. For other installation conditions such as water-saturated concrete or water-filled hole applications, see the associated strength reduction factors (\$\phi\$) for bond strength in the determination of controlling design strength values, as applicable.

- Concrete Breakout Strength Bond Strength/Pryout Strength
- 1. Tabular values are provided for illustration and are applicable for single anchors installed in cracked normal-weight concrete with minimum slab thickness, ha = hmin, and with the following conditions:
  - Ca1 is greater than or equal to the critical edge distance, Cac
  - ca2 is greater than or equal to 1.5 times ca1.
- 2. Calculations were performed according to ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308. The load level corresponding to the failure mode listed [Concrete breakout strength, bond strength/pryout strength] must be checked against the tabulated steel strength of the corresponding threaded rod or rebar size and type, the lowest load level controls.
- 3. Strength reduction factors (\$\phi\$) for concrete breakout strength are based on ACI 318 (-19 or -14) Section 5.3 for load combinations. Condition B was assumed.
- 4. Strength reduction factors ( $\phi$ ) for bond strength are determined from reliability testing and qualification in accordance with ICC-ES AC308 and are tabulated in this product information and in FSR-4027
- 5. Tabular values are permitted for static loads only, seismic loading is not considered with these tables. Periodic special inspection must be performed where required by code, see ESR-4027 for applicable information.
- 6. For anchors subjected to tension resulting from sustained loading a supplemental check must be performed according to ACI 318-19 17.5.2.2 or ACI 318-14 17.3.1.2.
- 7. For designs that include combined tension and shear, the interaction of tension and shear loads must be calculated in accordance with ACI 318 (-19 or -14) Ch.17.
- 8. Interpolation is not permitted to be used with the tabular values. For intermediate base material compressive strengths, please see ACI 318 (-19 or -14) Ch.17, ICC-ES AC308 and information included in this product supplement. For other design conditions including seismic considerations please see ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308 and ESR-4027.
- 9. Long term concrete temperatures are roughly constant over significant periods of time. Short-term elevated temperatures are those that occur over brief intervals, e.g. as a result of
- 10. The tabulated design strengths may be converted to allowable stress design values. Divide by conversion factor calculated as a weighted average of the load factors for the controlling load combination.
- 11. For seismic design in accordance with ACl 318, the tabulated tension design strengths in cracked concrete for concrete breakout and bond strength must be multiplied by a factor of 0.75. In the determination of the tension design strength values in cracked concrete, the bond strength requires an additional reduction factor applied for seismic tension (Q01,seis), where seismic design is applicable.
- 12. For other installation conditions such as water-saturated concrete or water-filled hole applications, see the associated strength reduction factors (\$\phi\$) for bond strength in the determination of controlling design strength values, as applicable.

- Tabular values are provided for illustration and are applicable for single anchors installed in uncracked normal-weight concrete with minimum slab thickness, ha = hmin, and with the following conditions:
  - Ca1 is greater than or equal to the critical edge distance, Cac
  - Ca2 is greater than or equal to 1.5 times Ca1.
- 2. Calculations were performed according to ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308. The load level corresponding to the failure mode listed [Concrete breakout strength, bond strength/ pryout strength] must be checked against the tabulated steel strength of the corresponding threaded rod or rebar size and type, the lowest load level controls.
- 3. Strength reduction factors ( $\phi$ ) for concrete breakout strength are based on ACl 318 (-19 or -14) Section 5.3 for load combinations. Condition B was assumed.
- 4. Strength reduction factors (\$\phi\$) for bond strength are determined from reliability testing and qualification in accordance with ICC-ES AC308 and are tabulated in this product information and in ESR-4027.
- 5. Tabular values are permitted for static loads only, seismic loading is not considered with these tables. Periodic special inspection must be performed where required by code, see ESR-4027 for applicable information.
- 6. For anchors subjected to tension resulting from sustained loading a supplemental check must be performed according to ACI 318-19 17.5.2.2 or ACI 318-14 17.3.1.2.
- 7. For designs that include combined tension and shear, the interaction of tension and shear loads must be calculated in accordance with ACI 318 (-19 or -14) Ch.17.
- 8. Interpolation is not permitted to be used with the tabular values. For intermediate base material compressive strengths, please see ACI 318 (-19 or -14) Ch.17, ICC-ES AC308 and information included in this product supplement. For other design conditions including seismic considerations please see ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308 and ESR-4027.
- 9. Long term concrete temperatures are roughly constant over significant periods of time. Short-term elevated temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.
- 10. The tabulated design strengths may be converted to allowable stress design values. Divide by conversion factor calculated as a weighted average of the load factors for the controlling load combination.
- 11. For other installation conditions such as water-saturated concrete or water-filled hole applications, see the associated strength reduction factors (φ) for bond strength in the determination of controlling design strength values, as applicable.

# Tension and Shear Design Strength for Reinforcing Bar Installed in Cracked Concrete (Bond or Concrete Strength) Drilled with a Hammer-Drill and Carbide Bit in a Dry Hole Condition Temperature Range A: 122°F (50°C) Maximum Long-Term Service Temperature;

■ - Concrete Breakout Strength ■ - Bond Strength/Pryout Strength

- Tabular values are provided for illustration and are applicable for single anchors installed in cracked normal-weight concrete with minimum slab thickness, ha = hmin, and with the following conditions:
  - Ca1 is greater than or equal to the critical edge distance, Cac
  - c<sub>a2</sub> is greater than or equal to 1.5 times c<sub>a1</sub>.
- Calculations were performed according to ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308. The load level corresponding to the failure mode listed [Concrete breakout strength, bond strength/ pryout strength] must be checked against the tabulated steel strength of the corresponding threaded rod or rebar size and type, the lowest load level controls.
- 3. Strength reduction factors ( $\phi$ ) for concrete breakout strength are based onACl 318 (-19 or -14) Section 5.3 for load combinations. Condition B was assumed.
- 4. Strength reduction factors (\$\phi\$) for bond strength are determined from reliability testing and qualification in accordance with ICC-ES AC308 and are tabulated in this product information and in ESR-4027.
- 5. Tabular values are permitted for static loads only, seismic loading is not considered with these tables. Periodic special inspection must be performed where required by code, see ESR-4027 for applicable information.
- 6. For anchors subjected to tension resulting from sustained loading a supplemental check must be performed according to ACI 318-19 17.5.2.2 or ACI 318-14 17.3.1.2.
- 7. For designs that include combined tension and shear, the interaction of tension and shear loads must be calculated in accordance with ACI 318 (-19 or -14) Ch.17.
- 8. Interpolation is not permitted to be used with the tabular values. For intermediate base material compressive strengths, please see ACI 318 (-19 or -14) Ch.17, ICC-ES AC308 and information included in this product supplement. For other design conditions including seismic considerations please see ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308 and ESR-4027.
- Long term concrete temperatures are roughly constant over significant periods of time. Short-term elevated temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.
- 10. The tabulated design strengths may be converted to allowable stress design values. Divide by conversion factor calculated as a weighted average of the load factors for the controlling load combination.
- 11. For seismic design in accordance with ACI 318, the tabulated tension design strengths in cracked concrete for concrete breakout and bond strength must be multiplied by a factor of 0.75. In the determination of the tension design strength values in cracked concrete, the bond strength requires an additional reduction factor applied for seismic tension (\alpha\_Nseis), where seismic design is applicable.
- 12. For other installation conditions such as water-saturated concrete or water-filled hole applications, see the associated strength reduction factors (φ) for bond strength in the determination of controlling design strength values, as applicable.

□ - Concrete Breakout Strength □ - Bond Strength/Pryout Strength

- Tabular values are provided for illustration and are applicable for single anchors installed in cracked normal-weight concrete with minimum slab thickness, ha = hmin, and with the following conditions:
  - Ca1 is greater than or equal to the critical edge distance, Cac
  - Ca2 is greater than or equal to 1.5 times Ca1.
- 2. Calculations were performed according to ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308. The load level corresponding to the failure mode listed [Concrete breakout strength, bond strength/ pryout strength] must be checked against the tabulated steel strength of the corresponding threaded rod or rebar size and type, the lowest load level controls.
- 3. Strength reduction factors (\$\phi\$) for concrete breakout strength are based on ACl 318 (-19 or -14) Section 5.3 for load combinations. Condition B was assumed.
- 4. Strength reduction factors (\$\phi\$) for bond strength are determined from reliability testing and qualification in accordance with ICC-ES AC308 and are tabulated in this product information and in ESR-4027.
- 5. Tabular values are permitted for static loads only, seismic loading is not considered with these tables. Periodic special inspection must be performed where required by code, see ESR-4027 for applicable information.
- 6. For anchors subjected to tension resulting from sustained loading a supplemental check must be performed according to ACI 318-19 17.5.2.2 or ACI 318-14 17.3.1.2.
- 7. For designs that include combined tension and shear, the interaction of tension and shear loads must be calculated in accordance with ACI 318 (-19 or -14) Ch.17.
- 8. Interpolation is not permitted to be used with the tabular values. For intermediate base material compressive strengths, please see ACI 318 (-19 or -14) Ch.17, ICC-ES AC308 and information included in this product supplement. For other design conditions including seismic considerations please see ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308 and ESR-4027.
- 9. Long term concrete temperatures are roughly constant over significant periods of time. Short-term elevated temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.
- 10. The tabulated design strengths may be converted to allowable stress design values. Divide by conversion factor calculated as a weighted average of the load factors for the controlling load combination.
- 11. For other installation conditions such as water-saturated concrete or water-filled hole applications, see the associated strength reduction factors (φ) for bond strength in the determination of controlling design strength values, as applicable.

# Tension and Shear Design Strength for Reinforcing Bar Installed in Cracked Concrete (Bond or Concrete Strength) Drilled with a Hammer-Drill and Carbide Bit in a Dry Hole Condition Temperature Range A: 122°F (50°C) Maximum Long-Term Service Temperature;

176°F (80°C) Maximum Short-Term Service Temperature<sup>1,2,3,4,5,6,7,8,9,10,11,12</sup>

- - Concrete Breakout Strength
   - Bond Strength/Pryout Strength
- Tabular values are provided for illustration and are applicable for single anchors installed in cracked normal-weight concrete with minimum slab thickness, ha = hmin, and with the following conditions:
  - ca1 is greater than or equal to the critical edge distance, cac
  - Ca2 is greater than or equal to 1.5 times Ca1.
- Calculations were performed according to ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308. The load level corresponding to the failure mode listed [Concrete breakout strength, bond strength/pryout strength] must be checked against the tabulated steel strength of the corresponding threaded rod or rebar size and type, the lowest load level controls.
- 3. Strength reduction factors ( $\phi$ ) for concrete breakout strength are based on ACI 318 (-19 or -14) Section 5.3 for load combinations. Condition B was assumed.
- Strength reduction factors (φ) for bond strength are determined from reliability testing and qualification in accordance with ICC-ES AC308 and are tabulated in this product information and in ESR-4027.
- 5. Tabular values are permitted for static loads only, seismic loading is not considered with these tables. Periodic special inspection must be performed where required by code, see ESR-4027 for applicable information.
- 6. For anchors subjected to tension resulting from sustained loading a supplemental check must be performed according to ACI 318-19 17.5.2.2 or ACI 318-14 17.3.1.2.
- 7. For designs that include combined tension and shear, the interaction of tension and shear loads must be calculated in accordance with ACI 318 (-19 or -14) Ch.17.
- 8. Interpolation is not permitted to be used with the tabular values. For intermediate base material compressive strengths, please see ACI 318 (-19 or -14) Ch.17, ICC-ES AC308 and information included in this product supplement. For other design conditions including seismic considerations please see ACI 318 (-19 or -14) Ch.17 and ICC-ES AC308 and ESR-4027.
- Long term concrete temperatures are roughly constant over significant periods of time. Short-term elevated temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.
- 10. The tabulated design strengths may be converted to allowable stress design values. Divide by conversion factor calculated as a weighted average of the load factors for the controlling load combination.
- 11. For seismic design in accordance with ACI 318, the tabulated tension design strengths in cracked concrete for concrete breakout and bond strength must be multiplied by a factor of 0.75. In the determination of the tension design strength values in cracked concrete, the bond strength requires an additional reduction factor applied for seismic tension (\(\omega\_{\text{constant}}\)), where seismic design is anniforable
- 12. For other installation conditions such as water-saturated concrete or water-filled hole applications, see the associated strength reduction factors (φ) for bond strength in the determination of controlling design strength values, as applicable.

#### - Steel Strength

- 1. Steel tensile design strength according to ACI 318 Ch.17,  $\phi$ Nsa =  $\phi$  Ase,N futa.
- 2. The tabulated steel design strength in tension must be checked against the bond strength/concrete capacity design strength to determine the controlling failure mode, the lowest load level controls.

### - Steel Strength

- 1. Steel shear design strength according to ACI 318 Ch.17,  $\phi V_{sa} = \phi \bullet 0.60 \bullet A_{se,V} \bullet f_{uta}$ .
- 2. The tabulated steel design strength in shear must be checked against the bond strength/concrete capacity design strength to determine the controlling failure mode, the lowest load level controls.
- 3. In the determination of the shear design strength values in cracked concrete, the steel strength requires an additional reduction factor applied for seismic shear (QV,sels), where seismic design is applicable.

For SI: 1 inch = 25.4 mm, 1 lbf = 4.448 N, 1 psi = 0.006897 MPa; for pound-inch units: 1 mm = 0.03937 inches, 1 N = 0.2248 lbf, 1 MPa = 145.0 psi.

- 1. Calculated development lengths in accordance with ACl 318-19 25.4.2.4, ACl 318-14 25.4.2.3 or ACl 318-11 12.2.3, as applicable, for reinforcing bars are valid for static, wind, and earthquake loads.
- 2. Calculated development lengths in SDC C through F must comply with ACI 318 (-19 or -14) Chapter 18 or ACI 318-11 Chapter 21, as applicable.
- 3. For Class B splices, minimum length of lap for tension lap splices is 1.3% in accordance with ACI 318 (-19 or -14) 25.5.2 and ACI 318-11 12.15.1, as applicable.
- 4. For lightweight concrete, λ = 0.75; therefore multiply development lengths by 1.33 (increase development length by 33 percent), unless the provisions of ACl 318-19 25.4.2.5, ACl 318-14 25.4.2.4 or ACl 318-11 12.2.4 (d), as applicable, are met to permit alternate values of λ (e.g for sand-lightweight concrete, λ = 0.85; therefore multiply development lengths by 1.18). Refer to ACl 318 (-19 or -14) 19.2.4 or ACl 318-11 8.6.1, as applicable.
- to ACI 318 (-19 or -14) 19.2.4 or ACI 318-11 8.6.1, as applicable. 5.  $\frac{C_b + K_b}{d_b} = 2.5$ ,  $\psi_t = 1.0$ ,  $\psi_s = 0.8$  for  $d_b \le \#6$ , and  $d_b \le \#6$  and  $d_b > 19$  mm. Refer to ACI 318-19 17.4.2.5, ACI 318-14 25.4.2.4 or ACI 318-11 12.2.4, as applicable.
- 6. Calculations may be performed for other steel grades and concrete compressive strengths per ACI 318 (-19 or -14) Chapter 25 or ACI 318-11 Chapter 12, as applicable.

- For SI: 1 inch = 25.4 mm,; for pound-inch units: 1 mm = 0.03937 inches.
- 1. For any case, it must be possible for the reinforcing bar (rebar) to be inserted into the cleaned hole without resistance.
- 2. Consideration should be given regarding the commercial availability of carbide drill bits (including hollow drill bits), as applicable, with lengths necessary to achieve effective embedments for post-installed reinforcing bar connections.

|               |                                                                              |                      |                          |                          |                     |                              |

- 2. Holes may be drilled with hammer-drill, i.e. rotary impact drills or rock drills with a carbide drill bit (including hollow bits).
- 3. For any case, it must be possible for the reinforcing bar to be inserted into the cleaned drill hole without resistance.
- 4. A brush extension (Cat.#PFC1671820) must be used with a steel wire brush for holes drilled deeper than the listed brush length.
- 5. Brush adaptors for power tool connections are available for SDS (Cat.#PFC1671830).
- 6. A flexible extension tube (Cat.#08297-PWR) or flexible extension hose (Cat.#PFC1640600) or equivalent approved by DEWALT must be used if the bottom or back of the anchor hole is not reached with the mixing nozzle only.
- 7. All overhead (i.e upwardly inclined) installations require the use of piston plugs during where one is tabulated together with the anchor size (see table). All horizontal installations require the use of piston plugs where the embedment depth is greater than 10 inches and the drill bit size is larger than 5/8-inch. A flexible extension tube (Cat.#08297-PWR) or flexible extension hose (Cat.#PFC1640600) or equivalent approved by DEWALT must be used with piston plugs.

**DUSTX+** 

# **INSTALLATION INSTRUCTIONS (SOLID BASE MATERIALS)**

- 1- Drill a hole into the base material with rotary hammer drill (i.e. percussion drill) and a carbide drill bit to the size and embedment required by the selected steel hardware element (reference installation specifications for threaded rod and reinforcing bar). The tolerances of the carbide drill bits, including hollow bits, must meet ANSI Standard B212.15.
- Precaution: Use suitable eye and skin protection. Avoid inhalation of dust during drilling and/or removal.
- Note! In case of standing water in the drilled hole (flooded hole condition), all the water has to be removed from the hole (e.g. vacuum, compressed air, etc.) prior to cleaning.

Drilling in dry base material is recommended when using hollow drill bits (vacuum must be on).

GO TO STEP 3 FOR HOLES DRILLED WITH DUSTX+™ EXTRACTION SYSTEM (NO FURTHER HOLE CLEANING IS REQUIRED); OTHERWISE GO TO STEP 2A FOR HOLE CLEANING INSTRUCTIONS.

2a- Starting from the bottom or back of the anchor hole, blow the hole clean with compressed air (min. 90 psi / 6 bar) a minimum of two times (2x). If the back of the drilled hole is not reached an extension shall be used.

2b- Determine brush diameter (see hole cleaning equipment selection table) for the drilled hole and brush the hole by hand or attach the brush with adaptor to a rotary drill tool or battery screw gun. Brush the hole with the selected wire brush a minimum of two times (2x). A brush extension (supplied by DEWÁLT) must be used for drill hole depth > 6" (150mm). The wire brush diameter must be checked periodically during use. The brush should resist insertion into the drilled hole, if not, the brush is too small and must be replaced with proper brush diameter (i.e. new wire brush).

2c- Finally blow the hole clean again with compressed air (min. 90 psi / 6 bar) a minimum of two times (2x). If the back of the drilled hole is not reached an extension shall be used. When finished the hole should be clean and free of dust, debris, ice, grease, oil or other foreign material.

- 3- Check adhesive expiration date on cartridge label. Do not use expired product. Review Safety Data Sheet (SDS) before use. Cartridge temperature must be between 41°F - 104°F (5°C - 40°C) when in use; except for installations in base material temperatures between 14°F and 23°F (-10°C and -5°C) the cartridge adhesive temperature must be conditioned to 50°F (10°C) minimum.. Review published working and cure times. Consideration should be given to the reduced gel (working) time of the adhesive in warm temperatures. For permitted range of the base material temperature, see published gel and curing times.
- Attach a supplied mixing nozzle to the cartridge. Unless otherwise noted do not modify the mixer in any way and make sure the mixing element is inside the nozzle. Load the cartridge into the correct dispensing tool.
- Note: Always use a new mixing nozzle with new cartridge of adhesive and also for all work interruptions exceeding the published gel (working) time of the adhesive

4- Prior to inserting the anchor rod or rebar into the filled drilled hole, the position of the embedment depth has to be marked on the anchor. Verify anchor element is straight and free of surface damage.

- 5- Adhesives must be properly mixed to achieve published properties. For new cartridges and nozzles, prior to dispensing adhesive into the drilled hole, separately dispense at least three full strokes of adhesive through the mixing nozzle until the adhesive is a consistent GRAY color.
- Review and note the published working and cure times (reference gel time and curing time table) prior to injection of the mixed adhesive into the cleaned anchor hole

# STALLATI

6- Fill the cleaned hole approximately two-thirds full with mixed adhesive starting from the bottom or back of the anchor hole. Slowly withdraw the mixing nozzle as the hole fills to avoid creating air pockets or voids. A plastic extension tube (Cat# 08281-PWR or 08297-PWR) or equivalent approved by DEWALT must be used with the mixing nozzle if the bottom or back of the anchor hole is not reached with the mixing nozzle (see reference tables for

Note! Piston plugs (see hole cleaning equipment selection table) must be used with and attached to the mixing nozzle and extension tube for: Overhead installations and installations between horizontal and overhead in concrete with anchors larger than 1/2", #4 and 10M.

All installations with drill hole depth > 10" (250mm)

• In the case that flexible tubing is used (Cat. #PFC1640600), the mixing nozzle may be trimmed at the preforation on the front port before attachment of the tubing. Verify the mixing element is inside the nozzle before use.

Attention! Do not install anchors overhead or upwardly inclined without installation hardware supplied by DEWALT and also receiving proper training and/or certification. Contact DEWALT for details prior to use, as applicable.

- 7- The anchor should be free of dirt, grease, oil or other foreign material. Push clean threaded rod or reinforcing bar into the anchor hole while turning slightly to ensure positive distribution of the adhesive until the embedment depth is reached. Observe the gel (working) time.
- 8- Ensure that the anchor element is installed to the specific embedment depth. Adhesive must completely fill the annular gap at the concrete surface. Following installation of the anchor element, remove excess adhesive. Protect the anchor element threads from fouling with adhesive. For all installations the anchor element must be restrained from movement throughout the specified curing period (as necessary) through the use of temporary wedges, external supports, or other methods. Minor adjustment to the position of the anchor element may be performed during the gel (working) time only.

- 9- Allow the adhesive anchor to cure to the specified full curing time prior to applying any load (reference gel time and curing time table).
- . Do not disturb, torque or load the anchor until it is fully cured.

- 10- After full curing of the adhesive anchor, a fixture can be installed to the anchor and tightened up to the maximum torque (reference installation specifications for threaded rod and reinforcing bar table) by using a calibrated torque wrench.
- Note! Take care not to exceed the maximum torque for the selected anchor.

# INSTALLATION INSTRUCTIONS POST-INSTALLED FOR REBAR CONNECTIONS

- 1- Drill a hole into the base material with rotary hammer drill (i.e. percussion drill) and a carbide drill bit to the size and embedment required by the selected steel hardware element (reference installation specifications for threaded rod and reinforcing bar). The tolerances of the carbide drill bits, including hollow bits, must meet ANSI Standard B212.15.
- Precaution: Use suitable eye and skin protection. Avoid inhalation of dust during drilling and/or removal.
- Note! In case of standing water in the drilled hole (flooded hole condition), all the water has to be removed from the hole (e.g. vacuum, compressed air, etc.) prior to cleaning.

Drilling in dry base materials is recommended when using hollow drill bits (vacuum must be on).

GO TO STEP 3 FOR HOLES DRILLED WITH DUSTX+" EXTRACTION SYSTEM (NO FURTHER HOLE CLEANING IS REQUIRED); OTHERWISE GO TO STEP 2A FOR HOLE CLEANING INSTRUCTIONS.

2a- Starting from the bottom or back of the drilled hole, blow the hole clean a minimum of two times (2x). Use a compressed air nozzle (min. 90 psi) for all sizes of reinforcing bar (rebar).

2b- Determine brush diameter (see hole cleaning accessories for post-installed rebar selection table) for the drilled hole and brush the hole by hand or attach the brush with adaptor to a rotary drill tool or battery screw gun. Brush the hole with the selected wire brush a minimum of two times (2x). A brush extension (supplied by DEWALT) must be used for drill hole depth > 6" (150mm). The wire brush diameter must be checked periodically during use. The brush should resist insertion into the drilled hole, if not, the brush is too small and must be replaced with proper brush diameter (i.e. new wire brush).

**2c-** Repeat Step 2a again by blowing the hole clean a minimum of two times (2x). When finished the hole should be clean and free of dust, debris, oil or other foreign material.

3- Check adhesive expiration date on cartridge label. Do not use expired product. Review Safety Data Sheet (SDS) before use. Review published gel (working) and cure times. Cartridge adhesive temperature must be between 41°F - 104°F (5°C - 40°C) when in use; except for installations in base material temperatures between 14°F and 23°F (-10°C and -5°C) the cartridge adhesive temperature must be conditioned to 50°F (10°C) minimum.

Note: Consideration should be given to the reduced gel (working) time of the adhesive in warm temperatures. For the permitted range of the base material temperature see published gel and cure times.

Attach a supplied mixing nozzle to the cartridge. Unless otherwise noted do not modify the mixer in any way and make sure the mixing element is inside the nozzle. Load the cartridge into the correct dispensing tool.

Note: Always use a new mixing nozzle with new cartridge of adhesive and also for all work interruptions exceeding the published gel (working) time of the adhesive.

4- Prior to inserting the rebar into the filled drilled hole, the position of the embedment depth has to be marked on the anchor. Verify anchor element is straight and free of surface damage.

5- Adhesive must be properly mixed to achieve published properties. Prior to dispensing adhesive into the drilled hole, separately dispense at least three full strokes of adhesive through the mixing nozzle until the adhesive is a consistent GRAY color.

Review and note the published gel (working) and cure times prior to injection of the mixed adhesive into the cleaned anchor hole.

### ISTALLATIO

6- Fill the cleaned hole approximately two-thirds full with mixed adhesive starting from the bottom or back of the anchor hole. Slowly withdraw the mixing nozzle as the hole fills to avoid creating air pockets or voids. A flexible extension tube (Cat.# 08297-PWR) or flexible extension hose (Cat.# PFC1640600) or equivalent approved by DEWALT must be used with the mixing nozzle if the bottom or back of the anchor hole is not reached with the mixing nozzle (see reference tables for installation). (see hole cleaning tools and accessories for post-installed rebar table)

Note! Piston plugs must be used with and attached to mixing nozzle and extension tube for overhead (i.e. upwardly inclined) installations and horizontal installations with rebar sizes larger than #4 and 10M. Insert piston plug to the back of the drilled hole and inject as described in the method above. During injection of the adhesive the piston plug will be naturally extruded from the drilled hole by the adhesive pressure.

In the case that flexible tubing is used (Cat. #PFC1640600), the mixing nozzle may be trimmed at the preforation on the front port before attachment of the tubing. Verify the mixing element is inside the nozzle before use.

Attention! Do not install anchors overhead or upwardly inclined without installation hardware supplied by DEWALT and also receiving proper training and/or certification. Contact DEWALT for details prior to use, as applicable.

- 7- The reinforcing bar should be free of dirt, grease, oil or other foreign material. Push clean rebar into the anchor hole while turning slightly to ensure positive distribution of the adhesive until the embedment depth is reached. Observe the gel (working) time.
- 8- Ensure that the anchor element is installed to the specific embedment depth. Adhesive must completely fill the annular gap at the concrete surface. Following installation of the anchor element, remove excess adhesive. Protect the anchor element threads from fouling with adhesive. For all installations the anchor element must be restrained from movement throughout the specified curing period (as necessary) through the use of temporary wedges, external supports, or other methods. Minor adjustment to the position of the anchor element may be performed during the gel (working) time only

- 9- Allow the adhesive anchor to cure to the specified full curing time prior to applying any load (reference gel time and curing time table).
- Do not disturb, torque or load the anchor until it is fully cured.
- 10- After full curing of the rebar connection, new concrete can be poured (placed) to the installed rebar connection.

- 1. An SDS-plus adaptor (Cat. #PFC1671830) is required to attach a steel wire brush to hammer drill. For hand brushing, attach manual brush wood handle (Cat. #PFC1671000) to the steel brush.
- 2. A brush extension (Cat. #PFC1671820) must be used with a steel wire brush for holes drilled deeper than the listed brush length.
- 3. If the DEWALT DustX+ extraction system is used to automatically clean holes during drilling, standard hole cleaning (i.e. brushing and removing dust/debris following drilling) is not required.

- 1. All overhead or upwardly inclined installations require the use of piston plugs where one is tabulated together with the anchor size.
- 2. All installations require the use of piston plugs where the embedment depth is greater than 10 inches and drill bit size is larger than 5/8-inch.
- 3. The use of piston plugs is also recommended for underwater installations where one is tabulated together with the anchor size.
- 4. A flexible plastic extension tube (Cat. #08281-PWR or #08297-PWR) or equivalent approved by DEWALT must be used with piston plugs.
